

External Quality Assessment Program for

Tropical fever multiplex, nucleic acid detection

Labquality, an independent provider of External Quality Assessment (EQA) schemes with over 50 years of experience, is introducing a new scheme for Tropical fever multiplex, nucleic acid detection. We are inviting a limited number of laboratories to participate in a pilot study of this new scheme free of charge. The scheme is suitable for clinical laboratories and point-of-care testing sites. The product contains selection of pathogens that may be causative agents of tropical fever, e.g. *Leptospira*, Chikungunya virus, Dengue virus (serotypes 1-4), *Plasmodium* spp. (*falciparum*, *vivax*, *ovale*), West Nile virus and Zika virus. The selection may be further developed based on feedback collected during the pilot study.

The pilot study includes three simulated samples to be analysed as routine patient samples according to the established workflow of the laboratory. Results will be submitted via the online platform LabScala and processed by the EQA Coordinator.

5557 Tropical fever multiplex, nucleic acid detection

- Samples:** 3 simulated samples for nucleic acid detection
- Distribution:** April 2027
- Registration:** Please register by [this link](#) or by scanning this QR code no later than 31 December 2026
